The User-Owned Behavioral Data Economy

Turning data into labor, and consent into currency.

We are building a marketplace where attention is capital and individuals participate in the upside of their own data. This is the shift from extraction to participation.

The Status Quo: Data Extraction Without Representation

The Extraction Model (Current)

Data-Yielding Houseplants.

Platforms water users with notifications and harvest clicks, but never pay rent. Users are fatigued, and trust is eroding.

The Opportunity (Missing Value)

Noisy Data.

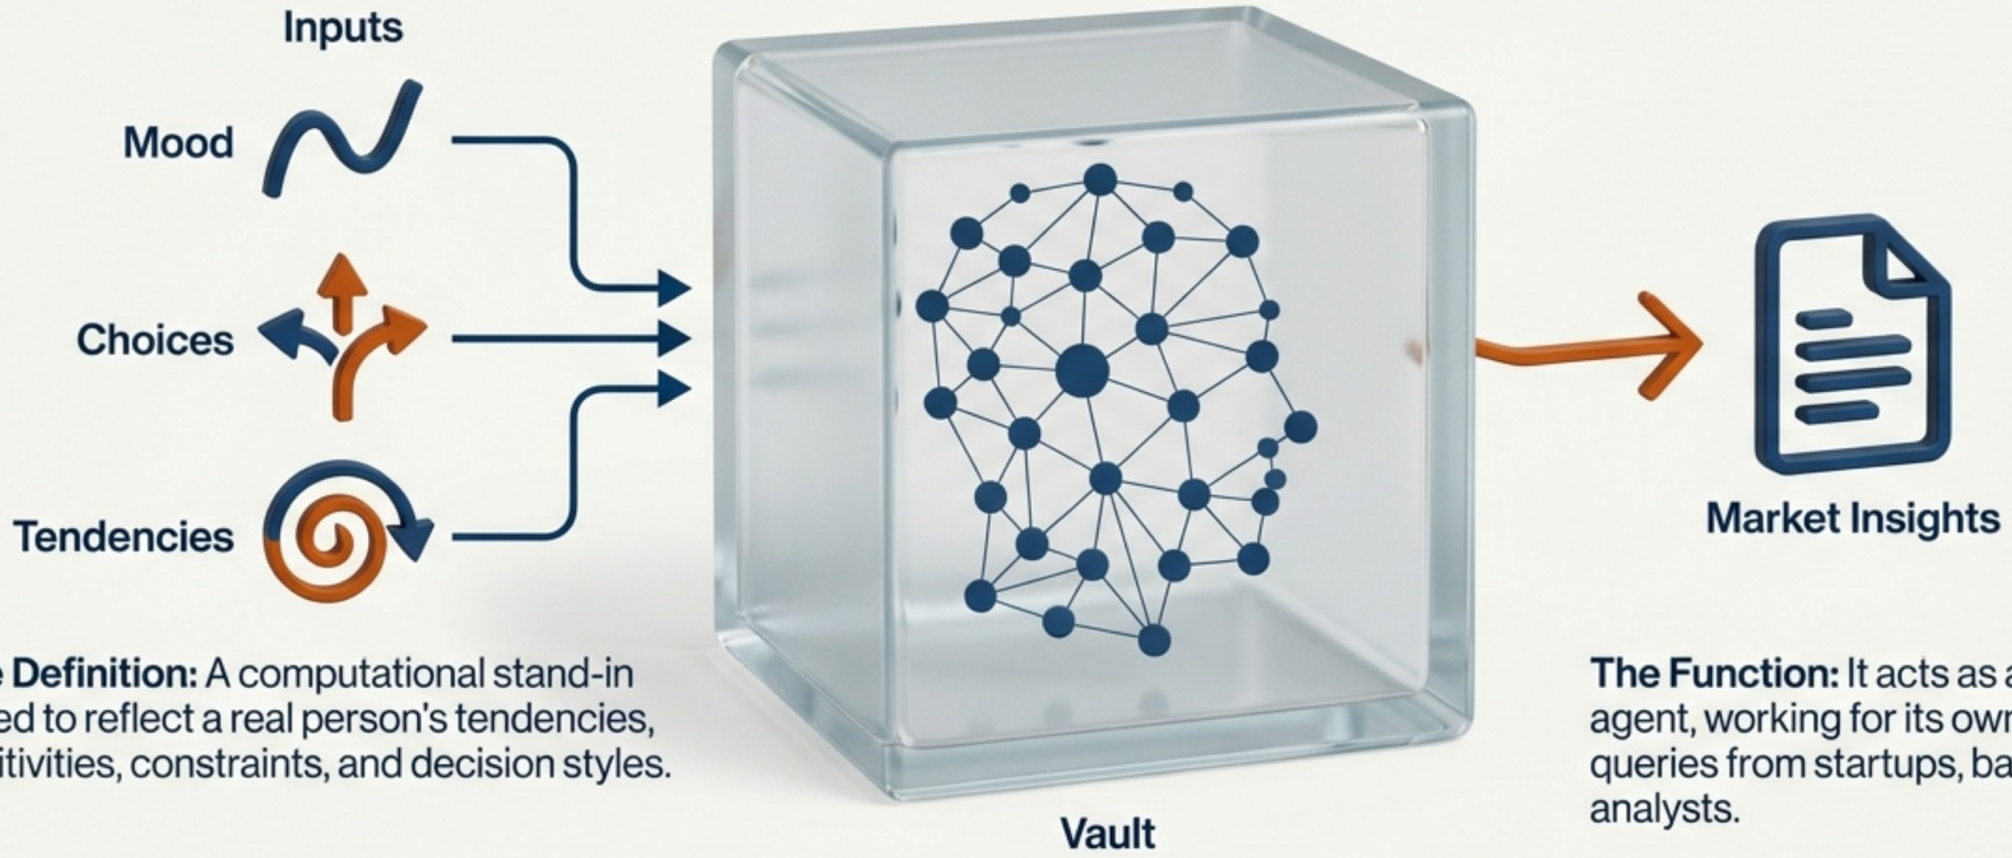

Because participation is compulsory and opaque, businesses rely on hidden data trails that lack context. Research is slow, expensive, and filled with "generic personas" rather than real behavioral insights.

Key Insight: The current dynamic is Surveillance Capitalism. We are proposing the inverse.

The Solution: The Behavioral Digital Twin

Anatomy of a Twin

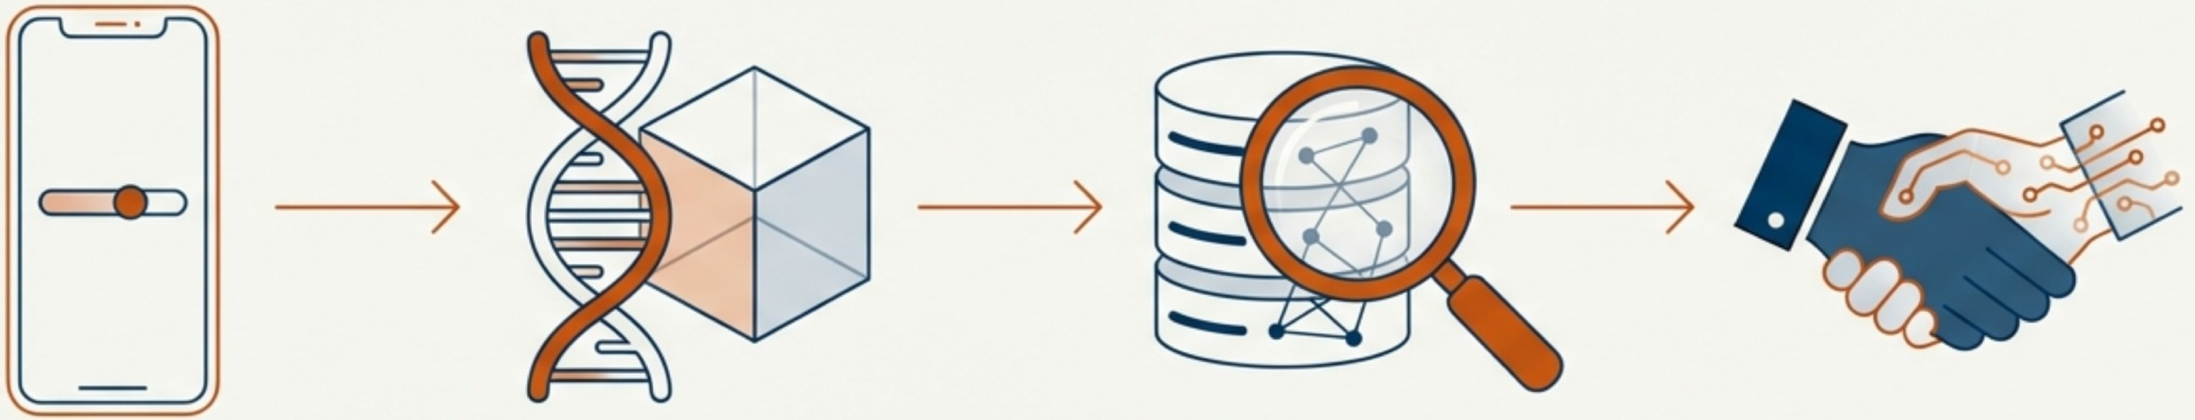

Core Definition: A computational stand-in trained to reflect a real person's tendencies, sensitivities, constraints, and decision styles.

The Function: It acts as an economic agent, working for its owner to answer queries from startups, banks, and analysts.

The Difference: Unlike free-range predictive models owned by corporations, this Twin is explicitly owned by the human. It sits in a vault. It works only when the human consents.

How It Works: The Data Lifecycle

1. Micro-Inputs

User provides gamified feedback (e.g., restaurant ratings, mood checks).

2. Evolution

The Twin learns and evolves. It absorbs longitudinal data to become a more accurate reflection of the user.

3. The Query

A business queries the database (e.g., “Will Gen Z buy this fintech app?”).

4. The Transaction

The Twins simulate a response. The Platform validates the data. The User gets paid.

The User Proposition: Value, Control, & Engagement

Value

Data becomes an income stream. It is meritocratic—if a user's twin is requested often (e.g., an ideal early adopter), they earn more.

Control

The ‘Killer Feature.’ Users define boundaries via sliders and toggles. Users verify: “Would you really choose this?” making it a co-creation.

Engagement

Moving beyond passive tracking. Features include ‘Reflection Dashboards’ to see how behavior evolves.

The Business Value: Instant, Granular Market Simulation

	Traditional Market Research	Digital Twin Simulation
Speed	Weeks/Months. Slow recruitment and scheduling.	Instant access to thousands of granular models.
Fidelity	Generic personas. Participants get tired or biased by interviewers.	Longitudinal consistency. Twins don't get tired or biased.
Scale	Expensive focus groups (N=10 to 50).	Simulate market reactions at scale (N=10,000+) before coding.

"Early-stage product validation on steroids."

Business Model:
The Digital Twin Data Exchange (DTDX)

Pay-Per-Survey

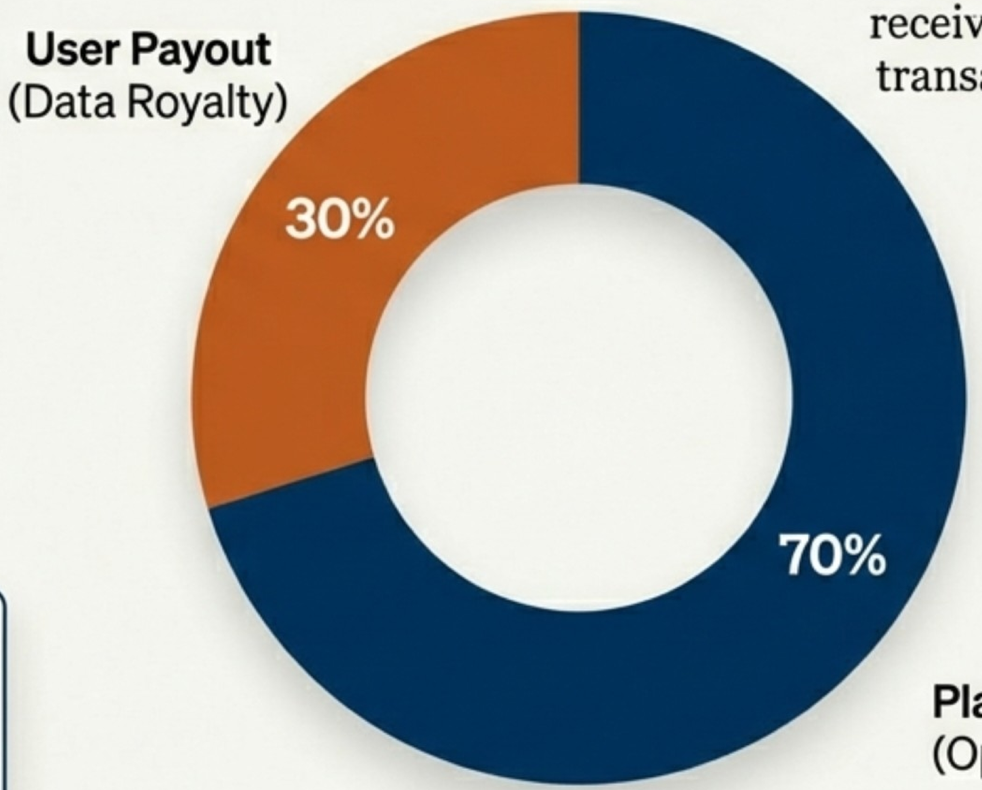

Transactional. €1–€10 per twin per test.

Subscriptions

- **Starter:** €99/mo (50 tests)
- **Growth:** €499/mo (1,000 tests, AI)
- **Enterprise:** €5,000+/mo (Unlimited, API)

Enterprise API

High-margin integrations for banks/insurers.

Fair Trade Data: Users receive ~30% of every transaction involving their twin.

The Flywheel Effect

Growth
High earnings/trust attract more users.

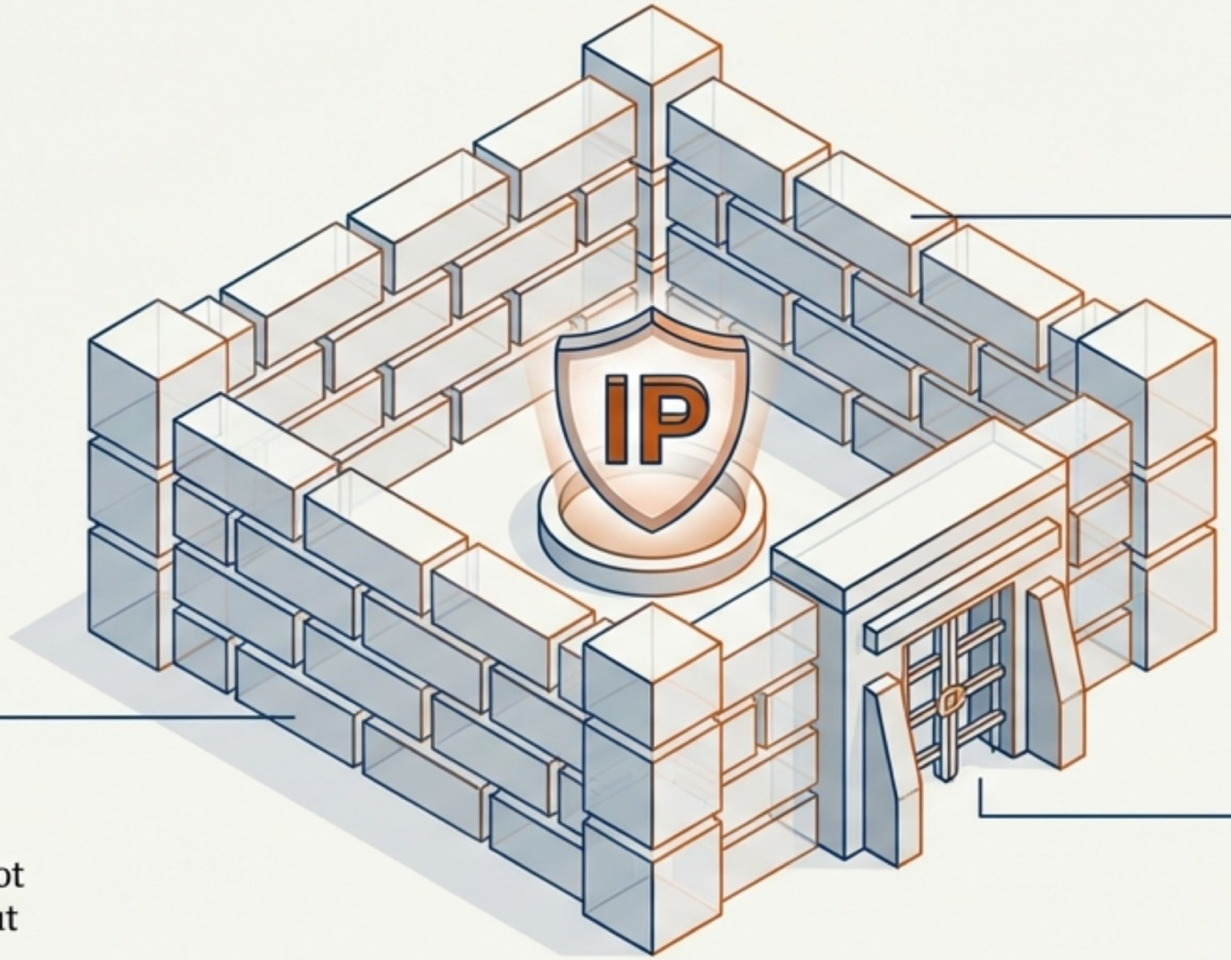

Better Twins
Data quality/accuracy increases.

Sustainability: As the marketplace grows, data quality increases, creating a barrier to entry.

Business Demand
Companies pay for high-fidelity insights.

Revenue Generation
More tests = higher user earnings.

Defensibility & Competitive Moat

Tech: Behavioral Embeddings (The Wall)

Longitudinal behavioral embeddings. Accurate twins are trained on history and context, not just one-off survey answers. Hard to fake.

Ethical Ownership (The Foundation)

Trust is the feature. Existing platforms (Google/Meta) cannot pivot to user-ownership without destroying their current ad-based revenue models.

Structure: IP Ownership (The Gate)

Users owning the IP of their Twin creates a sticky, loyal user base that travels with the platform.

Risk Mitigation: Trust as Infrastructure

Psychological Safety

Addressed through extreme transparency and “Opt-In Modularity.” No predictions are made without consent. We avoid “creepiness” by putting the user in charge.

Data Integrity

“Validation Pipelines” and accuracy certificates ensure Twins aren’t hallucinating. Use of longitudinal data prevents noise.

Regulatory & Ethics

User data is treated like bank deposits—full traceability and control. The system is designed to be a passive asset generator, not a manual labor “gig economy” trap.

Market Applications & Use Cases

Startups

A/B testing before coding.

Query example:
Which onboarding flow does this demographic prefer?

Banks / Fintech

Trust signaling and risk assessment.

Query example:
How does financial anxiety influence savings rates in this cohort?

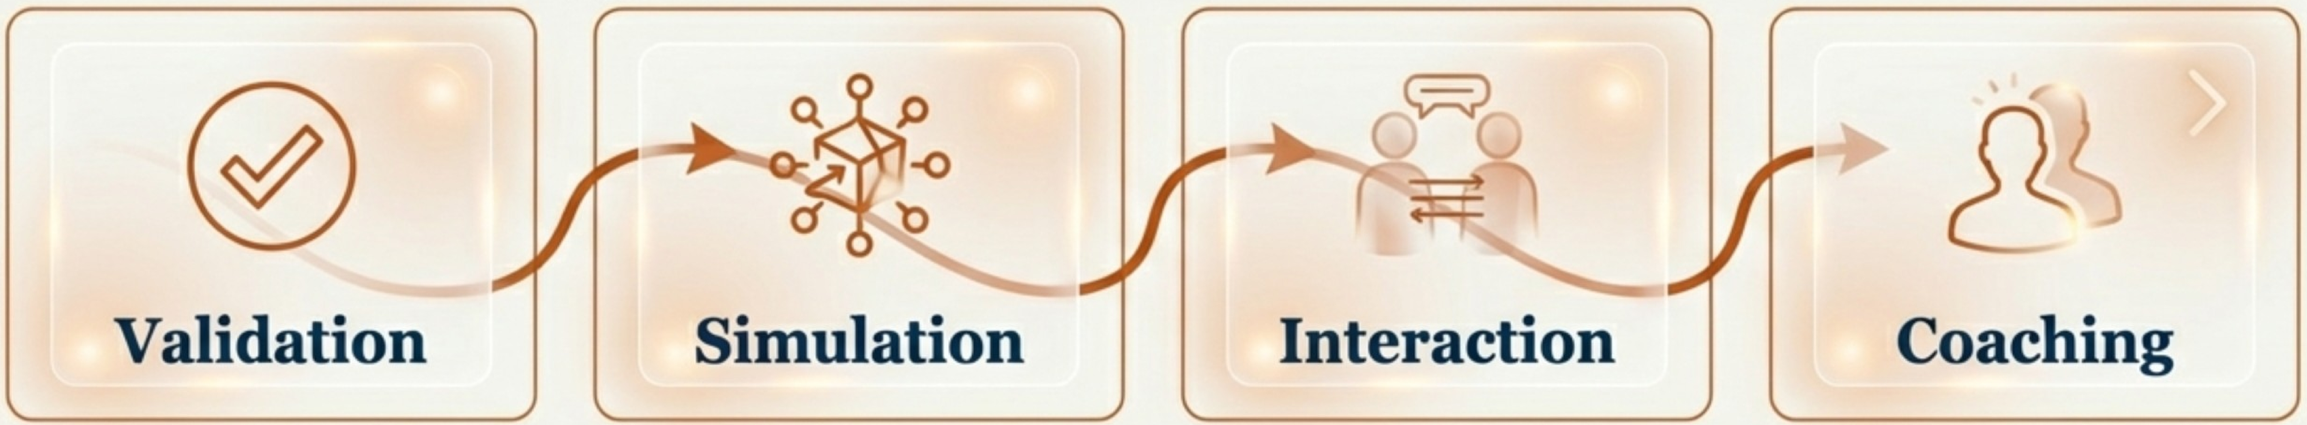

Policy Makers

Public reaction simulation.

Query example:
How will the public react to this new urban zoning policy?

Benefit: Reducing research noise through validated, user-backed models.

The Horizon: Beyond Surveys

Surveys & Idea Testing.
Twins answer structured questions.

Behavioral Simulation Marketplace.
Twins interact with products dynamically.

Twin-to-Twin Interactions.
Simulating complex market dynamics.
dynamics.

Personal Decision Coaching.
The Twin helps to the user reflect on life choices.

A New Social Contract

Data is Labor.

We are moving from an era of extraction to an era of participation.

The Old Model

Instagram takes behavioral data data and sells ads.

The New Model

DTDX takes behavioral data and lets users rent it out.

The Digital Twin is a personal asset—portable, owned, and compensated.
